

# THE DANGERS OF SWEATING SLAB SYNDROME

247,120

Occupational injuries and illnesses — related to falls, slips and trips — that led to private industry employees missing work in 2014.

## PROBLEMS CAUSED BY SWEATING SLAB SYNDROME

### INJURY RISK

Employees are more prone to slipping and falling.

### FORKLIFT FOLLY

Product transporters become more difficult to maneuver, and braking can fail.

### INVENTORY DAMAGE

Metal products are prone to corrosion; other products could deteriorate, and packaging can dampen.

### LUBRICANT LEAKS

The condensation on motorized machines can mix with chemical lubricants and leak.

### EFFLORESCENCE

Moisture prompts sulfates in the concrete to rise to the surface, resulting in salty deposits on the floor.

### BUILDING RISKS

Moisture promotes mold growth.

## TIPS FOR ALLEVIATING SWEATING SLAB SYNDROME

### AIR MOVEMENT

Increase movement with high-volume, low-speed fans. They force warm air downward, heating the cold surfaces—thus reducing condensation.

### DEHUMIDIFICATION SYSTEM

Installing a dehumidification system will decrease the amount of moisture in the air, drying out the facility.

### GOOD HOUSEKEEPING

Use cleaning agents to remove deposits, skid marks, etc. from the slab surface. These reduce the slab's ability to absorb moisture.

### VAPOR RETARDER

A low-permeance, below-slab retarder will prevent moisture in the concrete from rising to the surface, protecting products stored on the floor.
